Engineering Note:

The two tripod and one current mooring which we were unable to recover on OCEANUS were recovered in January, 1980 with the TUG WHITEFOOT (see cruise report). The release receiver batteries were found to be defective, and thus we could not communicate with the releases. One VACM was lost; because of the extensive grappling and search operations, we did not have time to recover a buoy with current meter underneath at Sta. B. Christmas and ship deadlines precluded another few hours of shiptime. We elected to deploy the new equipment, and recover the instrument later. On return to the site in January, the buoy was missing.
